

## GRC Risk and Compliance Tracking System - Page Functionality Descriptions

### Home Page (project\_home.php)

This page serves as the main navigation page of the GRC Risk and Compliance Tracking System. It provides links to all core functionalities of the system, including displaying risks, displaying audit results for controls, inserting new risks, inserting new controls, and searching for risks by level. The page allows users to easily navigate between different parts of the application.

### Display Risks with Owners and Departments Page (display\_risks.php)

This page displays information about risks along with their assigned employee owners and the departments of those employees. It extracts data from the Risk, Employee, and Department relations. For each risk, the page shows the risk ID, title, level, status, employee name, and department name. The department is determined through the employee's department assignment.

### Display Audit Results for Controls Page (display\_audit\_results.php)

This page displays audit results for controls. It extracts data from the Audit, Evaluates, and Control relations. The page shows each audit's ID, name, and date, along with the control that was evaluated, the control status, and the finding status (e.g., Pass or Fail) for that evaluation. This page allows users to view how controls performed in audits.

### Add Risk Page (insert\_risk.php)

This page provides a form that allows the user to insert a new risk into the database. The user enters the risk ID, risk title, risk level, risk status, and the employee ID of the employee who owns the risk. Upon submission, the page processes the input and inserts the new record into the Risk relation, then displays a confirmation message indicating whether the insertion was successful.

### Add Control Page (insert\_control.php)

This page provides a form that allows the user to insert a new control into the database. The user enters the control ID, control name, control status, and the employee ID of the employee who owns the control. Upon submission, the page processes the input and inserts the new record into the Control relation, then displays a confirmation message indicating whether the insertion was successful.

**Search Risks by Level Page (search\_risk.php)**

This page allows the user to search for risks based on their risk level. The user enters a risk level (e.g., High, Medium, Low) into a form. Upon submission, the page queries the Risk relation and displays all matching records, including the risk ID, title, level, and status.
