

RISK AND COMPLIANCE TRACKING SYSTEM

Presented by Krisztina Fabo

**“ARE OUR INTERNAL CONTROLS EFFECTIVE AT
STOPPING CYBER ATTACKS?”**

**“HOW OUR RESULTS OF THE LATEST AUDIT
TIE BACK TO OUR OVERARCHING LEGAL
COMPLIANCE?”**

PURPOSE OF THE PROJECT

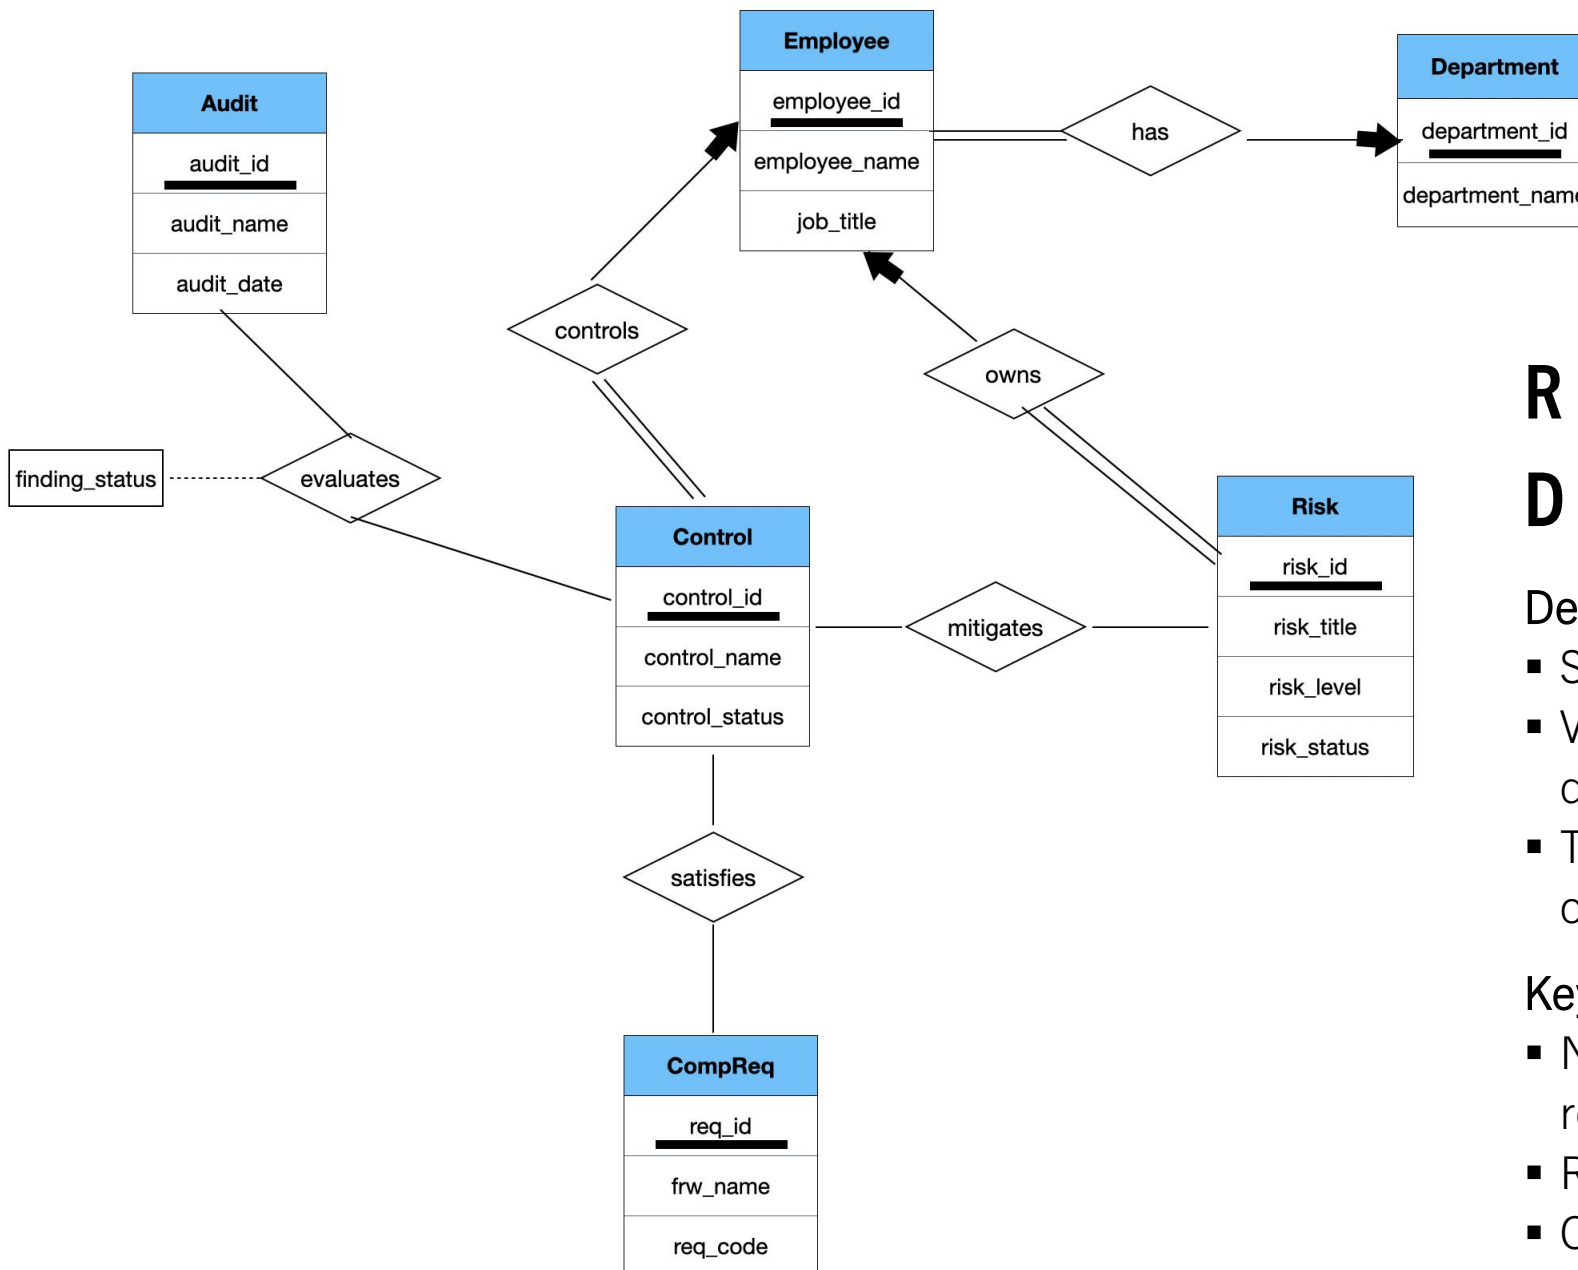

Problem:

- GRC data is often fragmented across systems
- Difficult to connect risks, controls, and audit results
- Limits visibility for decision-making

Goal:

Design a structured relational database system that enables organizations to better understand and manage risk and compliance

RELATIONSHIPS DRIVE VALUE

Design features

- Six core entities
- Value comes from relationships, not just data
- Traceability across risk, control, compliance, and audit

Key design decisions

- No redundant Risk–Department relationship
- Relationship attribute: finding_status
- Ownership enforced via foreign keys

BRIDGE BETWEEN THE USER AND THE DATABASE

https://pluto2.hood.edu/~kf19/GRC_Project/project_home.php

Display Risks with Owners and Departments

Risk ID	Risk Title	Risk Level	Risk Status	Employee Owner	Department
201	Unauthorized System Access	High	Open	Alice Johnson	IT
202	Financial Reporting Errors	Medium	Open	Brian Smith	Finance
203	Employee Data Exposure	High	Mitigated	Catherine Lee	Human Resources
204	Operational Process Failure	Low	Open	David Brown	Operations
205	Contract Compliance Risk	Medium	Closed	Emily Davis	Legal
206	Regulatory Noncompliance	High	Open	Frank Miller	Compliance

Search Risks by Level

TAKEAWAY

Lessons Learned

- Importance of normalization and avoiding redundancy
- Value of relationships in structuring complex data
- Translating real-world problems into database design

Future Work

- Improve user interface (dropdowns, usability)
- Add authentication and role-based access
- Extend system with reporting or dashboards

“How much potential financial risk is currently exposed due to controls that failed their most recent audit?”
